change before calculus was invented all math was static it could only help calculate objects that were perfectly still but the universe is constantly moving and changing no objects from the stars in space to subatomic particles or cells in the body are always at rest the word calculus comes from latin meaning small stone differential calculus cuts something into small pieces to find how it changes integral calculus joins integrates the small pieces together to find how much there is sam used differential calculus to cut time and distance into such small pieces that a pure answer came out in calculus the quotient rule is a method of finding the derivative of a function that is the ratio of two differentiable functions let $h(x) = \frac{f(x)}{g(x)}$ where both f and g are differentiable and $g(x) \neq 0$ the quotient rule states that the derivative of $h(x)$ is $h'(x) = \frac{f'(x)g(x) - f(x)g'(x)}{g(x)^2}$ calculus originally called infinitesimal calculus or the calculus of infinitesimals is the mathematical study of continuous change in the same way that geometry is the study of shape and algebra is the study of generalizations of arithmetic operations
